Practice with Spinors

I Algebra with Dirac γ matrices

Notation:

1. $S = \overline{u}u$
2. $P = \overline{u}\gamma^5 u$
3. $V^\mu = \overline{u}\gamma^\mu u$
4. $A^\mu = \overline{u}\gamma^\mu\gamma^5 u$
5. $T^{\mu\nu} = \overline{u}\sigma^{\mu\nu}u$

1. $(\overline{u}_1\gamma^\mu u_2)^* = ?$

   Note: $(\gamma^0)^\dagger = \gamma^0$ and $(\gamma^\mu)^\dagger = \gamma^0\gamma^\mu\gamma^0$

   $(\overline{u}_1\gamma^\mu u_2)$ is a 1×1 matrix. Therefore, its complex conjugate is the same as its Hermitian conjugate, i.e. if we call $L^\mu = (\overline{u}_1\gamma^\mu u_2)$, then $(L^\mu)^* = (L^\mu)^\dagger$. We can then express this quantity as follows:

$$
\begin{aligned}
L^\mu &= \overline{u}_1\gamma^\mu u_2 \ , \\
\Rightarrow (L^\mu)^* &= (L^\mu)^\dagger \ , \\
&= (\overline{u}_1\gamma^\mu u_2)^\dagger \ , \\
&= ((u_1)^\dagger\gamma^0\gamma^\mu u_2)^\dagger \quad \text{using } (A\ldots Z)^\dagger = Z^\dagger\ldots A^\dagger \ , \\
&= (u_2^\dagger)(\gamma^\mu)^\dagger(\gamma^0)^\dagger(u_1) \\
&= (u_2^\dagger)\gamma^0\gamma^\mu\gamma^0\gamma^0(u_1) \\
&= (u_2^\dagger)\gamma^0\gamma^\mu(u_1) \\
&= \overline{u}_2\gamma^\mu(u_1)
\end{aligned}
\tag{1}
$$

   Therefore $(\overline{u}_1\gamma^\mu u_2)^* = \overline{u}_2\gamma^\mu u_1$. To solve for $|L^\mu|^2$ we simply use $(L^{\mu\nu})^2 = \mathrm{Tr}[\overline{u}_1\gamma^\mu u_2\overline{u}_2\gamma^\nu u_1]$ (Why does L^μ have only one index but $L^{\mu\nu} = |L^\mu|^2$?)

   Note: $\mathrm{Tr}[\gamma^\mu\gamma^\nu] = 4g^{\mu\nu}$, $\mathrm{Tr}[\gamma^\mu\gamma^\nu\gamma^\lambda\gamma^\sigma] = 4(g^{\mu\nu}g^{\lambda\sigma} - g^{\mu\lambda}g^{\nu\sigma} + g^{\mu\sigma}g^{\nu\lambda})$, The trace of an odd number gamma matrix product is 0

$$
\begin{aligned}
(L^{\mu\nu})^2 &= \mathrm{Tr}[\overline{u}_1\gamma^\mu u_2\overline{u}_2\gamma^\nu u_1] \\
&= \mathrm{Tr}[\overline{u}_1\gamma^\mu(\not{p}_2 + m)\gamma^\nu u_1] \\
&= \mathrm{Tr}[u_1\overline{u}_1\gamma^\mu(\not{p}_2 + m)\gamma^\nu] \\
&= \mathrm{Tr}[(\not{p}_1 + m)\gamma^\mu(\not{p}_2 + m)\gamma^\nu] \\
&= \mathrm{Tr}[\not{p}_1\gamma^\mu\not{p}_2\gamma^\nu] + m[\mathrm{Tr}(\gamma^\mu\not{p}_1\gamma^\nu) + \mathrm{Tr}(\gamma^\mu\gamma^\nu\not{p}_2)] + m^2\mathrm{Tr}[\gamma^\mu\gamma^\nu] \\
&= \mathrm{Tr}[\not{p}_1\gamma^\mu\not{p}_2\gamma^\nu] + m^2\mathrm{Tr}[\gamma^\mu\gamma^\nu] \\
&= \mathrm{Tr}[(p_1)_\lambda\gamma^\lambda\gamma^\mu(p_2)_\sigma\gamma^\sigma\gamma^\nu] + 4m^2g^{\mu\nu}
\end{aligned}
\tag{2}
$$

$$
\begin{aligned}
&= (p_1)_\lambda (p_2)_\sigma \text{Tr}[\gamma^\lambda \gamma^\mu \gamma^\sigma \gamma^\nu] + 4m^2 g^{\mu\nu} \\
&= (p_1)_\lambda (p_2)_\sigma 4(g^{\mu\nu} g^{\lambda\sigma} - g^{\mu\lambda} g^{\nu\sigma} + g^{\mu\sigma} g^{\nu\lambda}) + 4m^2 g^{\mu\nu} \\
&= 4[p_1^\mu p_2^\nu - g^{\mu\nu}(p_1 \cdot p_2) + p_2^\mu p_1^\nu] + 4m^2 g^{\mu\nu} \\
&= 4[p_1^\mu p_2^\nu - 4g^{\mu\nu}(p_1 \cdot p_2 + m^2) + p_2^\mu p_1^\nu] \quad\quad\quad\quad\quad\quad\quad (3)
\end{aligned}
$$

2. $(\overline{u}_1 \gamma^\mu \gamma^5 u_2)^*$ is also a 1×1 Matrix so the same reasoning applies as above in 1. Note: $(\gamma^5)^\dagger = \gamma^5$

We define: R^μ as $\overline{u}_1 \gamma^\mu \gamma^5 u_2$ thus:

$$
\begin{aligned}
\Rightarrow (R^\mu)^* &= (R^\mu)^\dagger \quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad (4) \\
&= (\overline{u}_1 \gamma^\mu \gamma^5 u_2)^\dagger \\
&= ((u_1)^\dagger \gamma^0 \gamma^\mu \gamma^5 u_2)^\dagger \\
&= (u_2^\dagger)(\gamma^5)^\dagger (\gamma^\mu)^\dagger (\gamma^0)^\dagger (u_1) \\
&= (u_2^\dagger)\gamma^5 \gamma^0 \gamma^\mu \gamma^0 \gamma^0 u_1 \\
&= (u_2^\dagger)\gamma^5 \gamma^0 \gamma^\mu (1) u_1 \\
&= -(u_2^\dagger)\gamma^0 \gamma^5 \gamma^\mu u_1 \\
&= -\overline{u}_2 \gamma^5 \gamma^\mu u_1 \\
&= \overline{u}_2 \gamma^\mu \gamma^5 u_1 \quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad (\text{-2})
\end{aligned}
$$

Therefore $(\overline{u}_1 \gamma^\mu \gamma^5 u_2)^* = \overline{u}_2 \gamma^\mu \gamma^5 u_1$

We also are able to calculate $(R^\mu)^2$

$$
\begin{aligned}
(R^{\mu\nu})^2 &= \text{Tr}[\overline{u}_1 \gamma^\mu \gamma^5 u_2 \overline{u}_2 \gamma^\nu \gamma^5 u_1 \quad\quad\quad\quad\quad\quad\quad\quad (\text{-1}) \\
&= \text{Tr}[\overline{u}_1 \gamma^\mu \gamma^5 (\not{p}_2 + m)\gamma^\nu \gamma^5 u_1] \\
&= \text{Tr}[u_1 \overline{u}_1 \gamma^\mu \gamma^5 (\not{p}_2 + m)\gamma^\nu \gamma^5] \\
&= \text{Tr}[(\not{p}_1 + m)\gamma^\mu \gamma^5 (\not{p}_2 + m)\gamma^\nu \gamma^5] \\
&= \text{Tr}[\not{p}_1 \gamma^\mu \gamma^5 \not{p}_2 \gamma^\nu \gamma^5 + m(\not{p}_1 \gamma^\mu \gamma^5 \gamma^\nu \gamma^5 + \gamma^\mu \gamma^5 \not{p}_2 \gamma^\nu \gamma^5) + m^2(\gamma^\mu \gamma^5 \gamma^\nu \gamma^5)] \\
&= \text{Tr}[\not{p}_1 \gamma^\mu \gamma^5 \not{p}_2 \gamma^\nu \gamma^5 + m^2(\gamma^\mu \gamma^5 \gamma^\nu \gamma^5)] \\
&= \text{Tr}[(p_1)_\lambda \gamma^\lambda \gamma^\mu \gamma^5 (p_2)_\sigma \gamma^\sigma \gamma^\nu \gamma^5] + m^2 \text{Tr}[\gamma^\mu \gamma^5 \gamma^\nu \gamma^5] \\
&= (p_1)_\lambda (p_2)_\sigma \text{Tr}[\gamma^\lambda \gamma^\mu \gamma^5 \gamma^\sigma \gamma^\nu \gamma^5] - m^2 \text{Tr}[\gamma^\mu \gamma^5 \gamma^5 \gamma^\nu] \\
&= (p_1)_\lambda (p_2)_\sigma \text{Tr}[\gamma^\lambda \gamma^\mu \gamma^5 \gamma^5 \gamma^\sigma \gamma^\nu] - m^2 \text{Tr}[\gamma^\mu \gamma^\nu] \\
&= (p_1)_\lambda (p_2)_\sigma \text{Tr}[\gamma^\lambda \gamma^\mu \gamma^\sigma \gamma^\nu] - m^2(g^{\mu\nu}) \\
&= (p_1)_\lambda (p_2)_\sigma 4(g^{\mu\nu} g^{\lambda\sigma} - g^{\mu\lambda} g^{\nu\sigma} + g^{\mu\sigma} g^{\nu\lambda}) - 4m^2 g^{\mu\nu} \\
&= 4[p_1^\mu p_2^\nu - g^{\mu\nu}(p_1 \cdot p_2) + p_2^\mu p_1^\nu] - 4m^2 g^{\mu\nu} \\
&= 4[p_1^\mu p_2^\nu - 4g^{\mu\nu}(p_1 \cdot p_2 - m^2) + p_2^\mu p_1^\nu] \quad\quad\quad\quad\quad (\text{-11})
\end{aligned}
$$

3. $(\overline{u}_1 u_2)^* = ?$

We let: $P = \overline{u}_1 u_2$

$$
\Rightarrow (P)^* = (P)^\dagger , \quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad (\text{-11})
$$

2

$$
\begin{aligned}
&= \quad (\overline{u}_1 u_2)^\dagger \ , \\
&= \quad ((u_1)^\dagger \gamma^0 u_2)^\dagger \\
&= \quad (u_2)^\dagger (\gamma^0)^\dagger (u_1) \\
&= \quad (u_2)^\dagger \gamma^0 (u_1) \\
&= \quad \overline{u}_2 (u_1)
\end{aligned}
\tag{-14}
$$

Therefore $(\overline{u}_1 u_2)^* = \overline{u}_2 u_1$

In order to find $(P)^2$ we simply do the following:

$$
\begin{aligned}
(P)^2 &= \quad \mathrm{Tr}[\overline{u}_1 u_2 \overline{u}_2 u_1] \tag{-14} \\
&= \quad \mathrm{Tr}[(\not{p}_1 + m)(\not{p}_2 + m)] \\
&= \quad \mathrm{Tr}[\not{p}_1 \not{p}_2 + m(\not{p}_1 + \not{p}_2) + m^2] \\
&= \quad \mathrm{Tr}[\not{p}_1 \not{p}_2] + \mathrm{Tr}[m(\not{p}_1 + \not{p}_2)] + \mathrm{Tr}[m^2] \\
&= \quad \mathrm{Tr}[\not{p}_1 \not{p}_2] + m(\mathrm{Tr}[\not{p}_1] + \mathrm{Tr}[\not{p}_2]) + m^2 \mathrm{Tr}[1] \\
&= \quad \mathrm{Tr}[\not{p}_1 \not{p}_2] + 4m^2 \\
&= \quad 4(p_1 \cdot p_2) + 4m^2 \tag{-18}
\end{aligned}
$$

4. By the same reasoning as shown above it can be shown that $(\overline{u}_1 \gamma^5 u_2)^* = \overline{u}_2 \gamma^5 u_1$

If we let $T = \overline{u}_1 \gamma^5 u_2$ then:

$$
\begin{aligned}
\Rightarrow (T)^* &= \quad (T)^\dagger \ , \tag{-18} \\
&= \quad (\overline{u}_1 \gamma^5 u_2)^\dagger \ , \\
&= \quad ((u_1)^\dagger \gamma^0 \gamma^5 u_2)^\dagger \\
&= \quad (u_2)^\dagger (\gamma^5)^\dagger (\gamma^0)^\dagger (u_1) \\
&= \quad (u_2)^\dagger (-\gamma^5) \gamma^0 (u_1) \\
&= \quad (u_2)^\dagger \gamma^0 \gamma^5 (u_1) \\
&= \quad \overline{u}_2 \gamma^5 (u_1) \tag{-22}
\end{aligned}
$$

Therefore $(\overline{u}_1 \gamma^5 u_2)^* = \overline{u}_2 \gamma^5 u_1$

In order to square T we do the following:

$$
\begin{aligned}
T^2 &= \quad \mathrm{Tr}[\overline{u}_1 \gamma^5 u_2 \overline{u}_2 \gamma^5 u_1] \tag{-21} \\
&= \quad \mathrm{Tr}[u_1 \overline{u}_1 \gamma^5 \not{p}_2 \gamma^5] \\
&= \quad \mathrm{Tr}[\not{p}_1 \gamma^5 \not{p}_2 \gamma^5] \\
&= \quad \mathrm{Tr}[(p_1)_\mu \gamma^\mu \gamma^5 (p_2)_\nu \gamma^\nu \gamma^5] \\
&= \quad (p_1)_\mu (p_2)_\nu \mathrm{Tr}[\gamma^\mu \gamma^5 \gamma^\nu \gamma^5] \\
&= \quad -(p_1)_\mu (p_2)_\nu \mathrm{Tr}[\gamma^\mu \gamma^5 \gamma^5 \gamma\nu] \\
&= \quad -(p_1)_\mu (p_2)_\nu \mathrm{Tr}[\gamma^\mu \gamma^\nu] \\
&= \quad -(p_1)_\mu (p_2)_\nu (4g^{\mu\nu}) \\
&= \quad -4(p_1)(p_2)
\end{aligned}
$$

$$\tag{-28}$$

3

5. While the above identities could be shown to be trivial, the identity: $(\bar{u}_1\sigma^{\mu\nu}u_2)^* = \bar{u}_2\sigma^{\mu\nu}u_1$ is more difficult to solve

The identity:$(\sigma^{\mu\nu})^\dagger = \sigma^{\mu\nu}$ is needed

$$
\begin{aligned}
(\sigma^{\mu\nu})^\dagger &= (\frac{i}{2}[\gamma^\mu,\gamma^\nu])^\dagger & \text{(-28)}\\
&= (u_2)^\dagger(\sigma^{\mu\nu})^\dagger(\gamma^0)^\dagger u_1 \\
&= \frac{i}{2}([\gamma^\mu,\gamma^\nu])^\dagger \\
&= \frac{i}{2}(\gamma^\mu\gamma^\nu - \gamma^\nu\gamma^\mu)^\dagger \\
&= \frac{i}{2}((\gamma^\mu)^\dagger(\gamma^\nu)^\dagger - (\gamma^\nu)^\dagger(\gamma^\mu)^\dagger) \\
&= \frac{i}{2}(\gamma^0\gamma^\mu\gamma^0\gamma^0\gamma^\nu\gamma^0 - \gamma^0\gamma^\nu\gamma^0\gamma^0\gamma^\mu\gamma^0) \\
&= \frac{i}{2}(\gamma^0\gamma^\mu\gamma^\nu\gamma^0 - \gamma^0\gamma^\nu\gamma^\mu\gamma^0) \\
&= \frac{i}{2}((-1)^2\gamma^\mu\gamma^\nu - (-1)^2\gamma^\nu\gamma^\mu) \\
&= \frac{i}{2}(\gamma^\mu\gamma^\nu - \gamma^\nu\gamma^\mu) \\
&= \sigma^{\mu\nu} & \text{(-35)}
\end{aligned}
$$

After showing $(\sigma^{\mu\nu})^\dagger = \sigma^{\mu\nu}$ is true it is trivial to show $(\bar{u}_1\sigma^{\mu\nu}u_2)^* = \bar{u}_2\sigma^{\mu\nu}u_1$

We let $B^{\mu\nu} = \bar{u}_1\sigma^{\mu\nu}u_2$

$$
\begin{aligned}
\Rightarrow (B^{\mu\nu})^* &= (B^{\mu\nu})^\dagger, & \text{(-35)}\\
&= (\bar{u}_1\sigma^{\mu\nu}u_2)^\dagger, \\
&= ((u_1)^\dagger\gamma^0\sigma^{\mu\nu}u_2)^\dagger \\
&= (u_2^\dagger)(\sigma^{\mu\nu})^\dagger(\gamma^0)^\dagger(u_1) \\
&= (u_2^\dagger)\sigma^{\mu\nu}\gamma^0(u_1) \\
&= (u_2^\dagger)(\gamma^0)\sigma^{\mu\nu}(u_1) \\
&= \bar{u}_2\sigma^{\mu\nu}(u_1) & \text{(-39)}
\end{aligned}
$$

An interesting thing to note is that the expression $\bar{u}\sigma^{\mu\nu}\gamma^5 u$ is not an independent quantity. Since $\gamma^5 = i\gamma^0\gamma^1\gamma^2\gamma^3$ it follows that the product of $\sigma^{\mu\nu}$ and γ^5 can be simplified to an expression with only 2 γ matrices which has been defined as a pusedoscalar. For example, let $\mu = 0$ and $\nu = 1$:

$$
\begin{aligned}
\bar{u}\sigma^{01}\gamma^5 u &= \bar{u}\sigma^{01}(i\gamma^0\gamma^1\gamma^2\gamma^3)u & \text{(-39)}\\
&= \bar{u}((\frac{i}{2})(\gamma^0\gamma^1 - \gamma^1\gamma^0))(i\gamma^0\gamma^1\gamma^2\gamma^3)u \\
&= \bar{u}(\frac{i}{2})[\gamma^0\gamma^1(i\gamma^0\gamma^1\gamma^2\gamma^3) - \gamma^1\gamma^0(i\gamma^0\gamma^1\gamma^2\gamma^3)]u \\
&= \bar{u}(\frac{-1}{2})[\gamma^0\gamma^1\gamma^0\gamma^1\gamma^2\gamma^3 - \gamma^1\gamma^0\gamma^0\gamma^1\gamma^2\gamma^3)]u
\end{aligned}
$$

$$\begin{aligned}
&= \quad \overline{u}(\frac{-1}{2})[-\gamma^2\gamma^3 - \gamma^2\gamma^3)]u \\
&= \quad \overline{u}(\frac{-1}{2})[-2\gamma^2\gamma^3]u \\
&= \quad 2\overline{u}\gamma^2\gamma^3 u \qquad\qquad\qquad (\text{-43})
\end{aligned}$$

This expression (because it contains two gamma matrices) is a puesdoscalar. Any values of μ and ν can be shown to be similar to this because of the communal and indentity properties of the gamma matrices.

In order to find the value of $(B^{\mu\nu})^2$ one needs to do the following:

$$\begin{aligned}
(B^{\mu\nu\sigma\lambda})^2 &= \quad \mathrm{Tr}[\overline{u}_1\sigma^{\mu\nu}u_2\overline{u}_2\sigma^{\sigma\lambda}u_1] \\
&= \quad \mathrm{Tr}[\overline{u}_1\sigma^{\mu\nu}\not{p}_2\sigma^{\sigma\lambda}u_1] \\
&= \quad \mathrm{Tr}[\not{p}_1\sigma^{\mu\nu}\not{p}_2\sigma^{\sigma\lambda}] \\
&= \quad \mathrm{Tr}[p_\kappa\gamma^\kappa\sigma^{\mu\nu}p_\gamma\gamma^\gamma\sigma^{\sigma\lambda}] \\
&= \quad p_\kappa p_\gamma \mathrm{Tr}[\gamma^\kappa\sigma^{\mu\nu}\gamma^\gamma\sigma^{\sigma\lambda}] \\
&= \quad -\frac{1}{2}p_\kappa p_\gamma \mathrm{Tr}[\gamma^\kappa(\gamma^\mu\gamma^\nu - \gamma^\nu\gamma^\mu)\gamma^\gamma(\gamma^\sigma\gamma^\lambda - \gamma^\lambda\gamma^\sigma)] \\
&= \quad -\frac{1}{2}p_\kappa p_\gamma \mathrm{Tr}[2\gamma^\kappa\gamma^\mu\gamma^\nu\gamma^\gamma\gamma^\sigma\gamma^\lambda - 2\gamma^\kappa\gamma^\nu\gamma^\mu\gamma^\gamma\gamma^\sigma\gamma^\lambda] \\
&= \quad -\frac{1}{2}p_\kappa p_\gamma \mathrm{Tr}[4\gamma^\kappa\gamma^\mu\gamma^\nu\gamma^\gamma\gamma^\sigma\gamma^\lambda] \\
&= \quad -2p_\kappa p_\gamma \mathrm{Tr}[\gamma^\kappa\gamma^\gamma] \text{ Using a similar identity as shown in eq. 23} \\
&= \quad -8p_\kappa p_\gamma g^{\kappa\gamma} \qquad\qquad\qquad (\text{-51})
\end{aligned}$$
